The Earth System Grid Federation offers a variety of model outputs of the CMIP5 Global Climate Models from 20 climate modeling groups from all around the world. These outputs from will be analyzed and then published in the Fifth Assessment Report of Intergovernmental Panel on Climate Change (IPCC5), which will be published in Sep. 2013. Different model outputs from different experimental design may be accessible from the website. Depending on the model, ensemble, frequency, radiation scheme, time period of interest, we could choose the corresponding model results. An account is needed in order to access the result. The data could either be downloaded individually or using a Linux script.
